The method is used to provide plants with increased yield, improved ammonium assimilation properties, increased tolerance to ammonia toxicity, improved osmotic stress tolerance and improved composition. The present sequence represents the coding sequence of Chlorella sorokiniana NADP-glutamate dehydrogenase ligation construct of pBGDc53 plus pGDc64, used in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               음 성
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
The present invention relates to increasing or decreasing the nitrogen metabolism in plant cells by transforming a plant cell with a polypucleotide encoding a polypeptide having glutamate dehydrogenase (GDH) activity. The polypeptide is an alpha subunit of NADP-specific GDH (ADQ36707, ADQ36729), a beta subunit of NADP-specific GDH (ADQ36709), ADQ36731), or their fragments which exhibits GDH activity. The polymucleotide is operably linked to a polymucleotide encoding a chloroplast transit peptide comprising ADQ36710 or ADQ36711, or their fragments that exhibit chloroplast transit activity. The method is useful for increasing or decreasing the nitrogen metabolism in plant cells. The methods, polynucleotides, and polypeptides are useful in producing plant
                                                                                                                                                                                                                                                                                 Increasing or decreasing nitrogen metabolism in plant cells, for pluvith increased yield and improved tolerance to ammonia toxicity and osmotic stress, by transforming plant cell with nucleic acid having glutamate dehydrogenase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nitrogen metabolism; plant; glutamate dehydrogenase; GDH; enzyme; alpha subunit; NADP-specific GDH; NADP-specific glutamate dehydrogenase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                23-SEP-2004

The present sequence is the coding sequence for the precursor protein of the alpha subunit of the NADP-specific GDH, which is then processed to produce t mature alpha subunit of the NADP-specific GDH, used in the method of tinvention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 2124

It comprises the complete 3'-terminal region of the C. sorokiniana NADP-GDH sequence. 5' terminal regions were obtd. by PCR, yielding full-length clones (AAT64542-43) for the alpha and beta subunits of C. sorokiniana NADP-GDH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of modulating nitrogen metabolism in plant cells, comprising transforming a plant cell with a polynucleotide encoding a polypeptide having glutamate dehydrogenase activity, and culturing the cell to produce descendant cells which express the polypeptide. The method is used to provide plants with increased yield, improved ammonium assimilation properties, increased tolerance to ammonia toxicity, improved osmotic stress tolerance and improved composition. The present sequence represents the coding sequence of Chiorella sorokiniana MADP-glutamate dehydrogenase clone pBGDC53, used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Transforming a plant with a polynucleotide encoding a polypeptide with glutamate dehydrogenase activity provides a plant with modulated nitrogen metabolism useful to increase yield and ammonium and osmotic stress

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
The present invention relates to increasing or decreasing the nitrogen metabolism in plant cells by transforming a plant cell with a polypucleotide encoding a polypeptide having glutamate dehydrogenase (GDH) activity. The polypeptide is an alpha subunit of NADP-specific GI (ADQ36707, ADQ36729), a beta subunit of NADP-specific GDH (ADQ36709, ADQ36731), or their fragments, which exhibits GDH activity. The polypucleotide is operably linked to a polypucleotide encoding a chloroplast transit peptide comprising ADQ36710 or ADQ36711, or their fragments that exhibit chloroplast transit activity. The method is usef for increasing or decreasing the nitrogen metabolism in plant cells. The
                                                                                                                                                                                                                                                                 Increasing or decreasing nitrogen metabolism in plant cells, for plant with increased yield and improved tolerance to ammonia toxicity and osmotic stress, by transforming plant cell with nucleic acid having glutamate dehydrogenase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-MAY-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              methods, polynucleotides, and polypeptides are useful in producing plant with increased yield, and with improved tolerance to ammonia toxicity, osmotic stress, and composition of the crop or plant. The present sequence is the coding sequence for the precursor protein of the beta subunit of the NADP-specific GDH, which is then processed to produce the mature alpha subunit of the NADP-specific GDH, used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2076;

Increasing or decreasing nitrogen metabolism in plant cells, for plant with increased yield and improved tolerance to ammonia toxicity and osmotic stress, by transforming plant cell with nucleic acid having glutamate dehydrogenase activity.

Example 2 SEQ ID NO 18; 36pp; English.

The present invention relates to increasing or decreasing the nitrogen cc metabolism in plant cells by transforming a plant cell with a ccomplex polymucleotide encoding a polypeptide having glutamate dehydrogenase cc (GDH) activity. The polypeptide is an alpha subunit of NADP-specific GDH (ADQ36707, ADQ36729), a beta subunit of NADP-specific GDH (ADQ36709, Cc ADQ36731), or their fragments, which exhibits GDH activity. The cc polymucleotide is operably linked to a polymucleotide encoding a cc chloroplast transit peptide comprising ADQ36710 or ADQ36711, or their fragments that exhibit chloroplast transit activity. The method is useful for increasing or decreasing the nitrogen metabolism in plant cells. The methods, polymucleotides, and polypeptides are useful in producing plant cc with increased yield, and with improved tolerance to ammonia toxicity, cosmotic stress, and composition of the crop or plant. The present cc sequence is a cDNA clone which was isolated during the isolation of the invention. Sequence analysis revealed cc identified in an example from the invention. Sequence analysis revealed cc all ten clones were identical at their 3' terminian and differed by varying degree of truncation at their 5' terminial clone pBGDc53 (ADQ36712) was the longest clone and was found to have a complete 3' terminus, but was continued to determine the 5' terminal sequence using primers ADQ36713 ADQ36717 and ADQ36718), pRGDc 61 (ADQ36719), pGDc 63 (ADQ36721) and pGDc 64

                                                                                              The present invention relates to increasing or decreasing the nitrogen CC metabolism in plant cells by transforming a plant cell with a CC polynucleotide encoding a polypeptide having glutamate dehydrogenase CC (GDH) activity. The polypeptide is an alpha subunit of NADP-specific GDH (ADQ36707, ADQ36729), a beta subunit of NADP-specific GDH (ADQ36707), aDQ36729), a beta subunit of NADP-specific GDH (ADQ36709, CC ADQ3671), or their fragments, which exhibits GDH activity. The CC polynucleotide is operably linked to a polynucleotide encoding a CC chloroplast transit peptide comprising ADQ36710 or ADQ36711, or their fragments that exhibit chloroplast transit activity. The method is useful for increasing or decreasing the nitrogen metabolism in plant cells. The cc methods, polynucleotides, and polypeptides are useful in producing plant cc with increased yield, and with improved tolerance to ammonia toxicity, cosmotic stress, and composition of the crop or plant. The present composition of the invention. Ten NADP-GDH clones were identified in an example from the invention. Sequence analysis revealed compositified in an example from the invention. Sequence analysis revealed compositied of an example from the invention. Sequence analysis revealed composition of their 5' termini and differed by varying degree of truncation at their 5' termini and differed by varying degree of truncation at their 5' termini and differed by varying composition of the sound to determine the 5' terminal sequence using primers ADQ36712) was continue, but was not long enough to encode either NADP-GDH subunit and so PCR was carried out to determine the 5' terminal sequence using primers ADQ36713-ADQ36717 and ADQ36721) and the full-length clones ADQ36721) and pgDc 64 (ADQ36722) and the full-length clones ADQ36721 and ADQ36721 and ADQ36722) and the full-length clones ADQ36723 and ADQ36724.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      문

Increasing or decreasing nitrogen metabolism in plant cells, for plant with increased yield and improved tolerance to ammonia toxicity and osmotic stress, by transforming plant cell with nucleic acid having glutamate dehydrogenase activity.

Example 2; SEQ ID NO 7; 36pp; English.

The present invention relates to increasing or decreasing the nitrogen CC metabolism in plant cells by transforming a plant cell with a CC polynucleotide encoding a polypeptide having glutamate dehydrogenase CC (GDH) activity. The polypeptide is an alpha subunit of NADP-specific GDH (ADQ36707, ADQ36729), a beta subunit of NADP-specific GDH (ADQ36709, CC ADQ36701, or their fragments, which exhibits GDH activity. The CC polynucleotide is operably linked to a polynucleotide encoding a CC chloroplast transit peptide comprising ADQ36710 or ADQ36711, or their CC fragments that exhibit chloroplast transit activity. The method is useful CC for increasing or decreasing the nitrogen metabolism in plant cells. The methods, polynucleotides, and polypeptides are useful in producing plant CC sequence is a cDNA clone which was isolated during the isolation of the sequence is a cDNA clone which was isolated during the isolation of the ADDP-specific GDH cDNAs of the invention. Ten NADP-GDH clones were conducted and their 3' termini and differed by varying CC all ten clones were identical at their 3' termini and differed by varying CC degree of truncation at their 5' termini. Clone pBGDc53 (ADQ36712) was cont long enough to encode either NADP-GDH subunit and so PCR was carried out to determine the 5' terminal sequence using primers ADQ36713-ADQ36717 cand ADQ36719, pRGDc 61 (ADQ36719), pGDc 63 (ADQ36721) and pGDc 64 (ADQ36722) and the full-length clones ADQ36721 and ADQ36723 and ADQ36723 and ADQ36723 and ADQ36724.

                                                                                                                                                       APPLICANT: Schmidt, Robert R.
APPLICANT: Miller, Philip
TITLE OF INVENTION: NOVEL POLYPEPTIDES AND POLYNUCLEOTIDES
TITLE OF INVENTION: RELATING TO THE '- AND -SUBUNITS OF GI
TITLE OF INVENTION: DEHYDROGENASES AND METHODS OF USE
NUMBER OF SEQUENCES: 26
CORRESPONDENCE ADDRESS:
ZIP: 32606
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0,
                                                                                      STATE: F
                                                                                                  ADDRESSEE: Saliwanchik & Saliwanchik

                                                                                                                                                                                                                                                                                                                                                                                                                              303
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      243
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0
| Sequence 23, Application US/08828451 |
| Patent No. 5985634 |
| GENERAL INFORMATION: GENERAL INFORMATION: APPLICANT: Schmidt, Robert R. APPLICANT: Schmidt, Philip |
| ITILE OF INVENTION: NOVEL POLYPEPTIDES AND POLYNUCLEOTIDES |
| TITLE OF INVENTION: RELATING TO THE - AND -SUBUNITS OF GLUTAM |
| TITLE OF INVENTION: DEHYDROGENASES AND METHODS OF USE |
| NUMBER OF SEQUENCES: 26 |
| CORRESPONDENCE ADDRESS: ADDRESSEE: Saliwanchik & Saliwanchik |
| STREET: 2421 N.W. 41st Street, Suite A-1 |
| CITY: Gainesville |
| STATE: Florida
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                             δ
                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                 멍
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8
